

Defect Report:

Application: Tichi Web Application (Stage)

Field	Details
Bug ID	BUG-001
Title	Application accepts invalid email format and redirects the user to the Sign Up page
Module	Login
Environment	Windows 11, Google Chrome (Latest), Stage Environment
Severity	High
Priority	High
Status	Open
Reported By	Ramvasanth P
Description	The application accepts an invalid email format during login instead of displaying an email validation message.
Preconditions	User is on the Login page.
Steps to Reproduce	1. Open the application. 2. Navigate to Login. 3. Enter an invalid email such as 'abc.xyz@gmail.com', .abc@gmail.com, abc@gmail..com. 4. Click Continue
Expected Result	The application should validate the email format and prevent login, displaying an appropriate validation message.
Actual Result	The application accepts the invalid email address and redirects the user to the Sign Up page with the invalid email pre-filled.
Impact	Invalid data reaches the backend, causing poor input validation and potential security or usability issues.
Recommendation	Implement client-side and server-side email format validation using a standard email regex or validation library before processing the login request.

Evidence:

Screenshot: Login page displaying the invalid email address (abc.xyz@gmail.com) before clicking Continue.

Low Severity Validation Improvement:

Field	Details
Bug ID	BUG-002
Title	Application relies only on browser (HTML5) validation for Mobile Number field instead of application-level validation
Module	Sign Up
Environment	Windows 11, Google Chrome (Latest), Stage Environment
Severity	Low
Priority	Medium
Status	New
Reported By	Ramvasanth P
Description	Application relies only on browser (HTML5) validation for Mobile Number field instead of application-level validation
Preconditions	User is on the Sign Up page. Application is accessible. All mandatory fields are filled with valid data.
Steps to Reproduce	1.Open the application. 2.Navigate to Sign Up page 3.Enter valid values in: First Name Last Name Email Password Confirm Password 4.Enter an invalid mobile number(eg.12345) 5.Click Sign UP
Expected Result	The application should validate the mobile number at the application level and display a custom validation message such as: "Mobile number must contain exactly 10 digits."
Actual Result	the browser displays the default HTML5 validation message ,instead of application validation message. "Please lengthen this text to 10 characters or more (you are currently using 5 characters)."
Impact	1. Validation behavior depends on the browser implementation. 2. Browser validation can be bypassed using developer tools, automation scripts, or direct API requests. 3. Lack of application-level validation leads to an inconsistent user experience across browsers.
Recommendation	1. Display a custom validation message. 2. Perform validation on both the client side and server side. 3. Ensure invalid mobile numbers are rejected.

Evidence:

Screenshot: Browser displaying the default HTML5 validation message instead of an application generated validation message.
